

# Operating Instructions

DE08WT/DE09WT

## Network Wall Plate

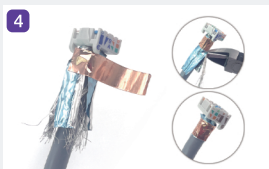

Strip off approximately 40 mm of the Ethernet cable outer sheath.

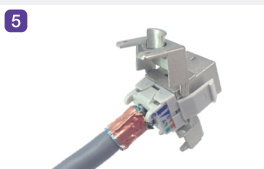

Peel off the aluminum foil, braid and ground wire (keep them) and wrap around the Ethernet cable.

Placing the wires in the wiring cap according to the wiring diagram (T568B/T568A), trim the wires to be level with the wiring cap.

Use copper foil to wrap the foil shield, braided shield and ground wire around the Ethernet cable.

Align the wiring cap and press it in.

Press both sides of the outer cover simultaneously to close it, use zip ties to bundle it, and then remove any excess shielding and zip ties.

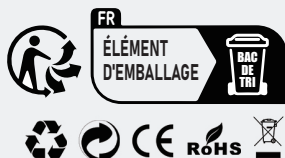

After separating the plastic part of the panel from the metal part, insert the keystone into the metal part according to the markings.

Secure the metal part to the wall using two screws.

Use screws to secure the plastic part to the metal part.
